Abstract— The multipurpose vertical plotter machine is a device which functions as drawing or writing robot which designs images on wall, prints text on panel or board. It can be used for diverse applications like interior design, wall design, notice board writing and Advertisement design.

Keywords— *CNC Machine, Vertical plotting, 3 axis control, embedded system, DC motors.*

I. INTRODUCTION

The present world is developing much technological advancement in order to solve critical problems and issues in an efficient way. It may be of reducing the resources use to solve any kind of problem and making the process easier. In context to this, we are creating a machine which helps to solve complexities in different fields of plotting pictures, texts and designs. Basically we are developing all in one vertical plotter machine which can be used to plot on walls, boards and panels in a flexible way.

In order to establish this machine, we are using the Computer Numerical Control (CNC) technology, using which the several motors are actuated to plot the design on the vertical panel. This CNC technology helps in creating required designs on the software and plotting that design on the XY plane with the help of various motors.

Multipurpose vertical plotter machine an embedded system that works based on the principle Computer Numerical Control (CNC)[2]. Multipurpose vertical plotter machine basically works with two stepper motors and a servo motor, the machine plots the design given to it from the software on any vertical panel using ATmega328P microcontroller on an open-source physical computing platform Arduino. The multipurpose vertical plotter machine has control over all 3 axis [4], horizontal and vertical control is done using stepper motors and servo motor is used to control the z axis. Each axis is powered and actuated by Arduino and a driver connected to it.

A multipurpose vertical plotter machine eliminates many disadvantages which are present in the conventional methods. For designing any vertical panel like board or wall, the conventional methods are highly depending on manual procedure. The man made writing and designs probably have less accuracy, poor quality and more error prone like writing errors may occur.

This machine is fully automatic and has computer based designs so it comes with high precision, better quality and less chance of error occurrence.

The plotters machines are predominantly horizontal plotters which can only plot the design on horizontal axis, with the help of plotter technology and adding verticality to its process fills the requirement of automatic vertical plotting in an efficient way.

II. PROPOSED METHODOLOGY

To establish this system we require different electronics hardware and software elements

- Hardware:
- 1. Arduino UNO
- 2. GRBL Shield
- 3. Water Level Sensor
- 4. Stepper Motors
- 5. Servo Motor
- 6. DC 12 volt 5A Rechargeable battery

Software:

- 1. Arduino IDE
- 2. Universal G-code Sender
- 3. Inkscape editor

A. Arduino UNO

Fig. 1: Arduino Uno board

One of the important device in our system is Arduino Uno which is shown in Fig.1. It is a development board[5] which contains the ATmega328P Microcontroller. It has 14 digital GPIO pins, 6 analogue IO pins, a 16 MHz crystal oscillator, a USB port, a power jack, a reset button and an ICSP header. The board has all the supportive hardware for microcontroller; we just need to connect it to a PC with a USB cable and supply the power.

Arduino is a core controller of this system, after creating the design in G-code format, we upload that to Arduino board, we connect GRBL shield to Arduino which acts as a driver to the actuators, the G-code received by the Arduino is sent to GRBL shield which eventually drives the stepper and servo motors.

B. GRBL Shield

GRBL is a acronym for garble which is the shield used to make our system compatible with CNC machine. It is an open source firmware, which mainly works in the motion control for CNC machines. In simple words, the GRBL software is uploaded to Arduino in order to control the motors. The below shown Fig.2 GRBL shield will be fit on to Arduino Uno which converts the G-code to motor motion.

Fig.2: GRBL Shield

The GRBL is very compatible to work with CNC machines with low-cost small scale microcontrollers. It has its various application with Arduino Uno, some of them are, laser Engraving/cutting machines, CNC milling machines, drawing machines.

C. Stepper Motors

Fig.3: Stepper motor

Fig.3 shows stepper motor which consist of rotor and coils, the rotor rotates when the pulse input is given to the coils. The direction of the rotation can be controlled by supplying the Pulse width modulated signals which are controlled by the Arduino board. Because of its precise

motion and high torque production in low power supplies, it is very much suitable for our system. It has various uses in low-cost and position control applications.

D. Servo Motor

Fig. 4: Servo motor

Fig.4 shows servo motor which is dc motor uses very less power and generates high precise degree rotations. When the electric signal is provided to servo motor, it changes its mechanical motion with accurate speed and direction control. In our system we are using servo motor to control the z-axis. The end-effectors like pen or brush is connected to this motor, it holds the pen up or down according to designing.

E. Arduino IDE

💿 sketch_jul12a Arduino 1.8.5 File Edit Sketch Tools Help	2 1 10	×

<pre>LE oid setup 0 { 2 // put your setup code here, to run onco 3 4 } 5 6 el void loop() { 7 // put your main code here, to run repe 9 9 }</pre>		

Fig.5: Arduino IDE

The Arduino IDE (Integrated Development Environment) shown in Fig.5 is an environment used to write logic code according to our system controlling requirements. It consists of an editor window, text console and toolbar for different functions. The environment is written in c and c++ functions. Initially we write our code here, then connect the board to the computer and upload all code to arduino board.

F. Inkscape editor

Fig.6: Inkscape editor

The CNC machine works on G-code input. Hence any kind of design we want to draw need to be converted to Gcode. As shown in Fig.6 Inkscape editor[7][8][9] which provides the facility to construct the design as per our requirement and convert it to G-code format. In Inkscape editor we can create or edit graphics such as diagrams, illustrations, line arts, charts, logos and complex paintings etc.

G. Universal G-code Sender

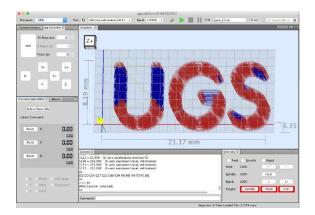

Fig.7: Universal G-code Sender

Fig.7 shows Universal G-code Sender, which is a platform used to upload the G-code to the GRBL through Arduino board. It is a java application compatible with Windows, mac ,OS X or Linux[10][11].

To understand the working methodology, we refer to block diagram and flow diagram.

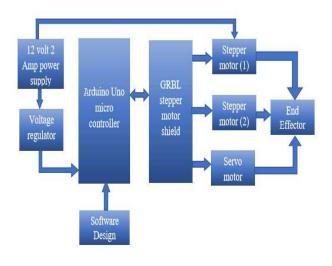

Fig.8 shows the block diagram of the multipurpose vertical plotter machine (MVPM). It has Arduino Uno as a core controller board which receives the input commands from software and drives the motors. The GRBL stepper motor shield will be connected on the top of the Arduino board to which the stepper motor drivers are connected.

It has two stepper motors and one servo motor. The stepper motors are used to actuate the end effector in x and y axis and servo motor to control in z- axis.

The 12 volt 2 amp supply is used to power up the stepper motors. The voltage regulator provides constant 5V power supply for Arduino uno.

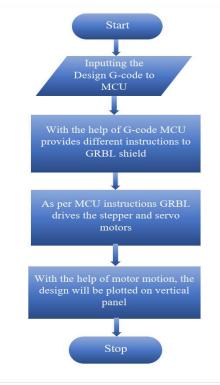

Fig.9: Work flow

The following steps Explains the methodology and flow of execution of the work.

1. Initially we create the required design on Inscape software and generate the equivalent G-code of the design file. (.G-code).

2. Then we upload the working program to Arduino Uno through Arduino IDE.

3. After generating the G-code in Incscape software we upload this G-code to arduino Uno using Universal G-code Sender (UGC) software.

4. When arduino Uno receives the code commands, with the help of GRBL shield, it actuates the stepper and Servo motors.

5. Because of movement of these motors, the end effector (e.g.: marker, brush) writes the same design on any kind of vertical panels like walls, boards etc.

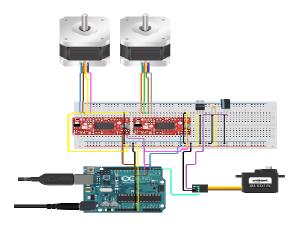

Fig.10: Circuit diagram

Fig.10 shows the Overall circuit connection diagram

III. RESULTS AND DISCUSSION

The main purpose of proposing this paper here is to bring up the discussion that, using CNC technology, we can build a machine which will be capable of designing anything on vertical panel with slight modification in end effectors. We have built the prototype of this machine which is shown in fig.11, as a first stage we have designed it as a predominant writer as we are connecting pen as end effector. But as we mentioned by developing the design, we can use it for multi-purpose applications like interior designing, designing of wall advertisements etc.

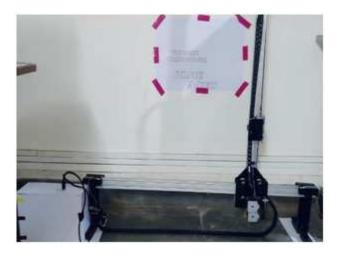

Fig.11: Prototype of proposed machine

We have only tested with pen as a end effector and the output is shown in fig.12. The resolution of the machine is 8 bits/pixels the gray scale values determine the resolution, higher the value, greater the resolution we get.

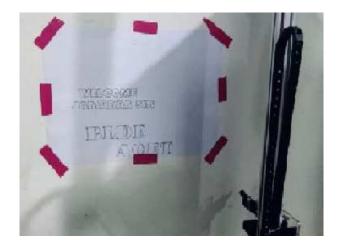

Fig.12: Plotted text

By studying the performance of the system, we can list some list advantages.

Advantages

- The machine works with high accuracy and as a robot it very high through put.
- Manual work is almost eliminated.
- The Machine has high performance rate and needs less maintenance
- Automatic handling of materials makes it more efficient.
- Operating is very reliable.

IV. CONCLUSION

By observing the total system construction and working, we can say the many problems regarding designs and writing can be solved using this machine, as it is automatic, issues related to human errors are eliminated, as it is a multipurpose device we can include many applications of designing. The conventional plotter which plots only in horizontal axis is here used as vertical plotter so as to fulfill our design requirements. Initially to develop the machine it may require costly components as application requirements and technically skilled operators are required for handling of the machine.

Hence, we can say that this multipurpose vertical plotter machine can bring a change in vertical designing world.
